Poly vs. Mudjacking

Mudjacking relies on underlying soils to support the lifted concrete. Heaving from a dramatic freeze and thaw cycle or settling from decaying tree roots or water damage can cause the underlying soils to shift and crack your concrete.

With polyurethane, however, the chemical reaction with the soil causes the foam to harden, so it doesn't fail. This stabilizes the soil and concrete, so your concrete should last a lifetime.

Concrete Leveling

Signs

Signs your home needs Concrete Leveling:

Have you noticed uneven concrete or cracking your driveway, sidewalk, and/or house floors?

Benefits to raising Concrete with Polyurethane Foam:

- Cost Effective
- Quick Time Frame
- Clean Work Environment
- Small Holes and Lightweight
- Hydrophobic (Poly foam won't wear away compared to mudjacking)

Solutions

→ DRILL IT

Polyurethane concrete only needs a 5/8 inch hole to raise it! That means fewer holes than traditional mudjacking and minimal patchwork needed.

→ PUMP IT

The Poly Foam is permanent and never loses its density, weighing less than mudjacking per cubic foot.

→ PATCH IT

Poly holes are then patched to concrete level. The process is quick and cost effective. Ready to use immediately!

The Process
