WHAT ARE SOME SIGNS?

Here are some clear signs that your home may need waterproofing:

- ✓ **Damp or musty odors** in basements, crawlspaces, or other areas.
- ✓ **Water stains** on walls, floors, or ceilings.
- ✓ **Peeling paint or wallpaper** caused by excess moisture.
- ✓ **Cracks in the foundation** or walls allowing water seepage.
- ✓ **Efflorescence** (white, chalky residue on walls from water evaporation).
- ✓ **Mold or mildew growth** in damp areas.
- ✓ **Warped or buckling floors** from moisture damage.

INTERIOR WATERPROOFING

- **Prepare the Work Area:** Implement dust control measures and ensure proper floor preparation.
- **Excavate Concrete Flooring:** Carefully remove the designated section of the concrete floor.
- **Install Drainage System:** Integrate a reliable drain system, vapor barrier, dehumidifier and sump pump to manage moisture effectively.
- **Restore Concrete Surface:** Re-pour and finish the concrete for a seamless and durable result.

VAPOR BARRIER

Vapor Barrier: Blocks moisture from seeping through walls or floors, keeping your home dry.
Drain System: Channels water away from your foundation, preventing leaks and flooding.

DRAIN SYSTEM

EXTERIOR WATERPROOFING

Involves sealing the outside of your home's foundation to keep water out. This includes excavating the soil, applying a waterproof coating or membrane, installing a drainage system, and adding a protective barrier to prevent moisture from reaching the foundation walls.

- **Prepare the Work Area:** Remove landscaping and locate utilities.
- **Excavate Foundation:** Expose the foundation wall and footing.
- **Install Waterproofing System:** Apply waterproof coating, drain tile, and connect to sump pump.
- **Restore Site:** Backfill and return the work area to its original condition.
